

Python & SQL Data Analysis Project

1. Project Name

Target Database SQL & Python Analysis

2. Project Description

- This project analyses customer, order, payment, seller, product, and geolocation data to identify
- business trends and generate meaningful insights. The project combines SQL-based data analysis with Python-based data manipulation and visualization.
- Technologies Used: SQL, MySQL Workbench, Python, Pandas, Matplotlib, and Google Colab. Approach: The datasets were explored and prepared first. SQL queries were then used to analyse
- business metrics and identify customer, order, seller, payment, product, and sales patterns. Python and Pandas were used for data transformation and analysis, while Matplotlib was used to create visualizations and communicate the findings.
- Key Analysis: The project includes analysis of order status, payment methods, product categories, customer and seller information, order trends, and visual representations such as monthly order trends, payment type distribution, and the top 10 product categories.
